

Abstract

The invention relates to a method for presenting information contained in messages in a terminal (MS). In the method, the message comprises at least one component. The message is transmitted to a terminal (MS) in a system for transmitting multimedia messages. In the method, a presentation model (SMIL) is formed to contain information related to the presentation of each component attached in the message. Said presentation model (SMIL) is supplemented with a reference about the location of each component in the message, and said presentation model (SMIL) is attached to said message.
